

# EnterCriticalSection

Thread termination or critical section deletion can cause undefined state

Description	<p>The EnterCriticalSection function waits for ownership of the specified critical section object. The function returns when the calling thread is granted ownership.</p> <p>If a thread terminates while it has ownership of a critical section, the state of the critical section is undefined.</p> <p>If a critical section is deleted while it is still owned, the state of the threads waiting for ownership of the deleted critical section is undefined.</p>		
APIs	Function Name		Comments
	EnterCriticalSection		
	InitializeCriticalSection		
Method of Attack			
Exception Criteria			
Solutions	Solution Applicability	Solution Description	Solution Efficacy
	Generally applicable.	To reduce impact of undefined states of critical sections and threads, ensure through path analysis that entry into a critical section	Somewhat effective.

1. <http://buildsecurityin.us-cert.gov/bsi-rules/35-BSI.html> (Barnum, Sean)

	is followed by an exit from the critical section.	
If you think a thread may die while holding a critical section.	Use a mutex, which has abandonment semantics.	Somewhat effective.
Generally applicable.	To reduce likelihood of deadlock scenarios, ensure that "time spent" in the critical section is as small as possible.	Somewhat effective.
On Windows 2000/NT: In low memory situations	Use structured exception handling, or call the InitializeCriticalSectionAndSpinCount function to preallocate the event used by EnterCriticalSection instead of calling the InitializeCriticalSection function, which forces EnterCriticalSection to allocate the event.	This is only effective in more optimized use of memory.
<b>Signature Details</b>	void EnterCriticalSection(LPCRITICAL_SECTION lpCriticalSection);	
<b>Examples of Incorrect Code</b>	<pre>// Global variable CRITICAL_SECTION CriticalSection;  void main() {     ...      // Initialize the critical section     one time only.     if (! InitializeCriticalSectionAndSpinCount(&amp;Critic 0x80000400) ) return;     ...      // Release resources used by the critical section object.</pre>	

	<pre> DeleteCriticalSection(&amp;CriticalSection) }  DWORD WINAPI ThreadProc( LPVOID lpParameter ) { [...]</pre> <pre> // Request ownership of the critical section. EnterCriticalSection(&amp;CriticalSection);  // Access the shared resource.  // Release ownership of the critical section. // If for whatever reason this call is omitted, then as noted in the description, behavior // is undefined. // LeaveCriticalSection(&amp;CriticalSection);  [...]</pre>
<b>Examples of Corrected Code</b>	<pre> // Global variable CRITICAL_SECTION CriticalSection;  void main() { ...  // Initialize the critical section one time only. if (! InitializeCriticalSectionAndSpinCount(&amp;CriticalSection, 0x80000400) ) return; ...  // Release resources used by the critical section object. DeleteCriticalSection(&amp;CriticalSection) }  DWORD WINAPI ThreadProc( LPVOID lpParameter ) { [...]</pre> <pre> // Request ownership of the critical section. EnterCriticalSection(&amp;CriticalSection);  // Access the shared resource.  // Release ownership of the critical section. LeaveCriticalSection(&amp;CriticalSection); </pre>
